

Project Executable Files

Date	29 September 2026
Team ID	SWTID-2026-7108
Project Name	Implement client script & UI Policy(Incident)
Maximum Marks	3 Marks

Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	NA
4	Database schema / seed files (if applicable)	NA
5	Environment configuration file (.env.example or similar)	NA
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

```
/Incident_ClientScript_UIPolicy
/update-set          - Exported ServiceNow Update Set XML
(Incident_Client_Script_and_UI_Policy.xml)
/scripts             - Copies of the Client Script text (as entered in the
ServiceNow Script field)
    onLoad_Incident_New_Record_Guidance.js
    onChange_Impact_High_Warning.js
    onChange_Category_Change_Handler.js
    onSubmit_Validate_Short_Description.js
/ui-policies         - UI Policy configuration details (conditions and actions)
/tests               - Test cases and test results
/screenshots         - Screenshots of the working solution
/docs                - Project documentation (PDF / Word)
README.md            - Setup and run instructions
```

Note: ServiceNow configuration is stored on the instance, so no requirements.txt, database schema or Dockerfile is needed. The Update Set XML is the deployable package.

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://devXXXXXX.service-now.com (replace with your PDI instance URL)
Login Credentials (Demo)	Username: <demo username> Password: <demo password> (create a demo user with the itil role for the evaluator)
Platform / Hosting Provider	ServiceNow Personal Developer Instance (PDI)
Repository Link	<GitHub repository link>
Demo Video Link	<Demo video link>

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

Pre-requisites:

- A ServiceNow Personal Developer Instance (or any instance where the evaluator has admin access).
- A modern web browser (Chrome, Edge or Firefox).
- The exported Update Set XML file from the /update-set folder.

Steps:

- **Step 1:** Log in to the ServiceNow instance as an administrator.
- **Step 2:** Navigate to System Update Sets > Retrieved Update Sets and click Import Update Set from XML.
- **Step 3:** Choose the file Incident_Client_Script_and_UI_Policy.xml and click Upload.
- **Step 4:** Open the retrieved update set and click Preview Update Set; resolve any reported problems.
- **Step 5:** Click Commit Update Set.

- **Step 6:** Verify under System UI > UI Policies and System Definition > Client Scripts that the new records are present and Active.
- **Step 7:** Open Incident > Create New and execute the test cases from the /tests folder (for example set Impact and Urgency to 1 - High, set State to Resolved, enter a short Short description and try to save).

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Client Scripts and UI Policies run only in the browser UI; they do not apply to imports, integrations or list edits done outside the form.	Add a server-side Business Rule or Data Policy for those cases (future enhancement).
2	A Personal Developer Instance can be reclaimed or hibernate after a period of inactivity.	Log in to the developer portal to wake the instance; re-import the Update Set if needed.
3	Field names and choice values (for example On hold reason) can differ between ServiceNow releases.	Verify field names in the UI Policy Actions on the target release before testing.
