

## Solution Requirements

|                      |                                                |
|----------------------|------------------------------------------------|
| <b>Date</b>          | 29 September 2026                              |
| <b>Team ID</b>       | SWTID-2026-7108                                |
| <b>Project Name</b>  | Implement Client Script & UI Policy (Incident) |
| <b>Maximum Marks</b> | 4 Marks                                        |

### Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

### Step 1: Functional Requirements (FR)

| S.No | Requirement Category    | Requirement Description                                                                                                                                                                                                               | Priority (High/Medium/Low) |
|------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| 1    | Authentication          | Users log in to the ServiceNow instance with their user ID and password (or SSO). Only authenticated users can open or update the Incident form.                                                                                      | High                       |
| 2    | Authorization levels    | Service Desk Agent (itil role): create and update incidents. Admin: create and maintain Client Scripts and UI Policies. Caller (end user): raise and view own incidents only.                                                         | High                       |
| 3    | External interfaces     | No third-party APIs. Uses internal ServiceNow data: User, Location and Department tables, and the Category / Subcategory choice lists.                                                                                                | Medium                     |
| 4    | Transactions processing | Client Scripts run on form load, field change and submit. onChange auto-populates caller details, and onSubmit checks the data before the incident is saved.                                                                          | High                       |
| 5    | Reporting               | Standard incident lists and reports to check that close code and close notes are filled for Resolved and Closed incidents.                                                                                                            | Medium                     |
| 6    | Business rules, etc.    | Subcategory is filtered by Category. Close code and close notes are mandatory when State is Resolved or Closed. On hold reason is visible and mandatory only when State is On Hold. An alert is shown when Priority is Critical (P1). | High                       |

| S.No | Requirement Category              | Requirement Description                                                                                                     | Priority (High/Medium/Low) |
|------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|----------------------------|
| 7    | Compliance to laws or regulations | Follow the organisation's data privacy policy. Caller data stays inside the instance and is protected by role-based access. | Medium                     |
| 8    | Other                             | All scripts and policies are packaged in one Update Set so they can be moved to another instance easily.                    | Low                        |

## Step 2: Non-Functional Requirements (NFR)

| S.No | NFR Category               | Requirement Description                                                                            | Target Metric / Acceptance Criteria                                                     |
|------|----------------------------|----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| 1    | Performance & Speed        | Scripts and policies must not slow down the Incident form.                                         | Form loads in under 3 seconds; auto-populated values appear in under 2 seconds.         |
| 2    | Scalability                | Logic runs in the browser, so many agents can work at the same time without extra server load.     | Supports all concurrent service desk agents on the instance.                            |
| 3    | Security & Data Privacy    | Client-side rules are backed by roles and access controls. Scripts must not expose sensitive data. | Only authorised roles can edit scripts and policies; no sensitive data shown in alerts. |
| 4    | Reliability & Availability | Form behaviour must be the same every time for every agent.                                        | 100% of planned test cases pass; availability follows the ServiceNow instance uptime.   |
| 5    | Usability & Accessibility  | Messages are short and clear. Mandatory fields are clearly marked.                                 | Every rule shows a plain-language message; mandatory fields show the required marker.   |
| 6    | Other                      | Maintainability: scripts have clear names and comments so any team member can update them.         | Each script has a description and comments; all changes are tracked in one Update Set.  |
