

## Technology Stack

|                      |                                                |
|----------------------|------------------------------------------------|
| <b>Date</b>          | 29 September 2026                              |
| <b>Team ID</b>       | SWTID-2026-7108                                |
| <b>Project Name</b>  | Implement Client Script & UI Policy (Incident) |
| <b>Maximum Marks</b> | 2 Marks                                        |

### Define Your Technology Stack:

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

### Technology Stack Details

| S.No | Architecture Component / Layer        | Technology Chosen                                                                                        | Justification / Purpose                                                                                                                                       |
|------|---------------------------------------|----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | <b>Frontend / Client-Side</b>         | ServiceNow Incident form (Next Experience / Classic UI) with Client Scripts (JavaScript) and UI Policies | Client Scripts and UI Policies run in the user's browser, so field changes, mandatory rules and alerts respond instantly without a page reload.               |
| 2    | <b>Backend / Server-Side</b>          | ServiceNow platform server (Glide APIs, GlideAjax, Business Rules)                                       | Used when a client script needs server data, such as looking up the caller's department and location. Also keeps server-side checks as a safety net.          |
| 3    | <b>Database / Data Storage</b>        | ServiceNow database: Incident [incident], User [sys_user], Location and Department tables                | Built into the platform with strong relational mapping, so no separate database setup is needed. Incident records and caller details are read and saved here. |
| 4    | <b>Cloud / Hosting / Deployment</b>   | ServiceNow Personal Developer Instance (PDI)                                                             | Free, cloud-hosted instance for development and testing. No hardware or hosting cost, and it is always available for the whole team.                          |
| 5    | <b>Version Control &amp; CI/CD</b>    | ServiceNow Update Sets; GitHub for script backup                                                         | Update Sets capture all client scripts and UI policies for safe movement between instances. GitHub keeps a shared copy of the scripts for team collaboration. |
| 6    | <b>Third-Party APIs / Other Tools</b> | GlideForm (g_form), GlideUser (g_user), Script Debugger, browser JavaScript Console                      | No external API is needed. The built-in client APIs set, hide and validate fields, and the debugging tools help test and fix scripts.                         |
