

Phase 1 – Brainstorming & Ideation

1. Project Title

Implement Client Script & UI Policy for Incident Management in ServiceNow

2. Problem Identification

In ServiceNow, Incident records need accurate and complete information for proper incident management. If users enter incomplete or incorrect information, it can affect incident assignment, prioritization, reporting, and resolution.

Therefore, a solution is needed to automatically control fields and validate information while users create or update Incident records.

3. Proposed Idea

The proposed project uses ServiceNow UI Policies and Client Scripts to control Incident form behavior.

The system will:

- Make Assigned To mandatory when Impact is High.
- Automatically set Urgency to High when Impact is High.
- Make the Urgency field read-only for High Impact incidents.
- Prevent saving a High Impact incident when Assigned To is empty.
- Prevent users from changing State through list editing.
- Allow State changes normally through the Incident form.
- Reverse the field restrictions when Impact is changed from High to another value.

4. Objectives

- Improve data accuracy in Incident records.
- Reduce incomplete Incident submissions.
- Automate field updates based on conditions.
- Control field visibility, mandatory status, and read-only behavior.
- Validate Incident information before saving.
- Demonstrate practical use of ServiceNow Client Scripts and UI Policies.

5. Key Technologies

- **Platform:** ServiceNow
- **Module:** Incident Management
- **UI Component:** UI Policy and UI Policy Action
- **Scripting:** JavaScript
- **Client Scripts:** onChange, onSubmit, onCellEdit

6. Expected Outcome

The project will provide a controlled Incident form where important fields automatically respond to the selected Impact. This helps maintain consistent and valid Incident data while reducing manual errors.

7. Idea Summary

Input: Incident details entered by the user

↓

Condition: Impact = High

↓

UI Policy: Assigned To becomes mandatory and Urgency becomes read-only

↓

onChange Script: Urgency automatically changes to High

↓

onSubmit Script: Checks whether Assigned To is filled

↓

onCellEdit Script: Prevents State changes from list editing

↓

Output: Accurate and properly validated Incident record
