

Phase 2 – Requirement Analysis

1. Functional Requirements

The system should provide the following functionalities:

1. The system should work with Incident records in ServiceNow.
2. When Impact = High, the Assigned To field should become mandatory.
3. When Impact = High, the Urgency field should become read-only.
4. When Impact is changed to High, Urgency should automatically be set to High.
5. The system should prevent saving a High Impact Incident when Assigned To is empty.
6. The system should display an error message when the required Assigned To field is missing.
7. Users should not be allowed to change the State field through list editing.
8. Users should be able to change the State field normally from the Incident form.
9. When Impact changes from High to another value, the UI Policy restrictions should be reversed.
10. The system should allow the Incident to be saved when all required conditions are satisfied.

2. Non-Functional Requirements

- The solution should be easy to use.
- The scripts should execute efficiently on the client side.
- The system should provide clear error or information messages.
- The configuration should be simple and maintainable.
- The solution should improve data consistency and accuracy.
- The implementation should work within the standard ServiceNow Incident module.

3. Hardware Requirements

No special hardware is required.

- Computer/Laptop
- Internet connection for accessing the ServiceNow instance

4. Software Requirements

- ServiceNow Instance
- Web Browser such as Chrome, Edge, or Firefox
- JavaScript support
- ServiceNow Incident Management module

5. User Requirements

The user should be able to:

- Create and update Incident records.
- Select the Impact value.
- Enter Assigned To when required.
- View the automatically updated Urgency.
- Update State through the Incident form.
- Receive appropriate messages when an action is not allowed.

6. Business Rules Identified

Condition	Expected Behavior
Impact = High	Assigned To becomes mandatory
Impact = High	Urgency becomes read-only
Impact changes to High	Urgency automatically becomes High
High Impact + Assigned To empty	Record cannot be saved
State edited from list	Change should be blocked
State edited from form	Change should be allowed
Impact changes from High to Medium/Low	UI Policy restrictions should be reversed

7. Expected Result

The requirement analysis establishes that the project must combine UI Policies, UI Policy Actions, and Client Scripts to control Incident form behavior and validate data before submission.
