

Phase 3 – Project Design Phase

1. System Design

The Implement Client Script & UI Policy (Incident) project is designed to control and validate Incident records in ServiceNow.

The system uses:

- **UI Policy** – Controls field behavior based on conditions.
- **UI Policy Action** – Makes fields mandatory/read-only.
- **onChange Client Script** – Automatically updates Urgency.
- **onSubmit Client Script** – Validates Assigned To before saving.
- **onCellEdit Client Script** – Prevents State changes through list editing.

2. System Flow

3. UI Policy Design

UI Policy: High Impact Control

Property	Value
Name	High Impact Control
Table	Incident
Active	True
Condition	Impact is 1 – High
Reverse if false	True

UI Policy Action

The UI Policy controls the **Assigned To** and **Urgency** fields.

Assigned To:

- **Mandatory** → True

Urgency:

- **Read-only** → True
- **Visible** → No change

When Impact is no longer High, the Reverse if false option restores the normal field behavior.

4. Client Script Design

A. onChange Client Script

Name: Auto set urgency for high impact

Property	Value
Table	Incident
Type	onChange
Field	Impact
Active	True

Purpose:

When Impact is changed to High, the system automatically sets Urgency to High.

B. onSubmit Client Script

Name: Prevent save if Assigned To missing

Property	Value
Table	Incident
Type	onSubmit
Active	True

Purpose:

Before saving the Incident, the script checks whether Assigned To is empty when Impact is High.

- **If Assigned To is empty** → Display error and prevent saving.
- **If Assigned To is filled** → Allow saving.

C. onCellEdit Client Script

Name: Prevent state change via list edit

Property	Value
Table	Incident
Type	onCellEdit
Field	State
Active	True

Purpose:

Prevents users from changing the State directly from the Incident list.

The user must open the Incident form to change its State.

5. Data Flow

User enters Incident details

Impact selected

High

Other

UI Policy

Normal

Assigned To → Mandatory

Urgency → Read-only

onChange Script

Urgency = High

User clicks Submit

onSubmit Validation

Assigned To available?

Yes → Save

No → Error → Stop Save

6. Design Components

Component	Purpose
Incident Table	Stores Incident records
High Impact Control	Main UI Policy
Assigned To	Mandatory for High Impact
Urgency	Automatically set to High and made read-only
Impact	Triggers the conditional behavior
State	Controlled during list editing
onChange Script	Sets Urgency automatically
onSubmit Script	Validates Assigned To
onCellEdit Script	Blocks State list editing

7. Expected Design Outcome

The designed system provides dynamic field control, automatic value population, save-time validation, and list-edit restriction for Incident records. This design ensures that Incident information follows the defined project rules before it is submitted or modified.
