

Phase 8 – Project Demonstration Phase

1. Demonstration Overview

The final phase demonstrates the working of the Implement Client Script & UI Policy (Incident) project in the ServiceNow platform.

The demonstration should explain the Project Name, Purpose, Benefits, Working Process, Configuration, and Final Output.

2. Project Name

Implement Client Script & UI Policy (Incident)

3. Purpose of the Project

The purpose of this project is to improve the accuracy and consistency of Incident records in ServiceNow by using UI Policies and Client Scripts.

The system automatically controls fields, validates user input, and prevents incorrect updates.

4. Demonstration Flow

Step 1 – Open Incident

Open the ServiceNow platform and navigate to:

Incident → Create New

Show the Incident form and its important fields such as:

- Impact
- Urgency
- Assigned To
- State

Step 2 – Demonstrate High Impact

Set:

Impact → High

Show that:

- Assigned To becomes mandatory
- Urgency becomes read-only
- Urgency is automatically set to High

Explain that these behaviors are controlled by the UI Policy and onChange Client Script.

Step 3 – Demonstrate Save Validation

Leave Assigned To empty and click Submit.

Expected result:

- The Incident should not be saved.
- An error message should be displayed.

Explain that the onSubmit Client Script validates the Assigned To field.

Step 4 – Demonstrate Successful Save

Select a valid user in Assigned To.

Click Submit.

Expected result:

Incident is saved successfully.

Explain that the validation condition is now satisfied.

Step 5 – Demonstrate Reverse Condition

Open the Incident and change:

Impact: High → Medium

Expected result:

- Assigned To is no longer mandatory because of the UI Policy.
- Urgency becomes editable again.

Explain the role of Reverse if false.

Step 6 – Demonstrate List Edit Restriction

Navigate to:

Incident → All

Try to edit the State field directly from the list.

Expected result:

An alert message appears:

→ State cannot be updated using list editing. Please open the Incident.

The State change should be cancelled.

Explain that this behavior is controlled by the onCellEdit Client Script.

Step 7 – Demonstrate Form-Based State Update

Open the same Incident record.

Change the State from the Incident form and click Update.

Expected result:

State is updated successfully.

This demonstrates that State changes are allowed through the Incident form but blocked through direct list editing.

5. Final Output

The final system demonstrates:

Feature	Result
High Impact Control	Working
Assigned To Mandatory	Working
Urgency Auto Update	Working
Urgency Read-only	Working
Save Validation	Working
Reverse Condition	Working
State List Edit Blocking	Working
Form-Based State Update	Working

6. Benefits Demonstrated

The project demonstrates how ServiceNow can:

- Improve Incident data accuracy.
- Reduce incomplete submissions.
- Automate field values.
- Control user interaction with fields.
- Prevent unauthorized list-based changes.
- Provide validation before saving records.

7. Demo Video Structure

For the required Google Drive demo video, follow this order:

1. Introduction

2. Project Name

3. Problem Statement

4. Objective

5. Technologies Used

6. UI Policy Demonstration

7. onChange Script Demonstration

8. on Submit Validation Demonstration

9. onCellEdit Demonstration

10. Successful Save Demonstration

11. Final Output

12. Conclusion

Final Conclusion

The project successfully demonstrates the practical implementation of ServiceNow UI Policies and Client Scripts for Incident Management. The configured solution dynamically controls fields, automatically updates values, validates records before submission, and restricts unwanted list-based changes. This improves the consistency, accuracy, and reliability of Incident records.
